

# Ephesoft Transact

## A Powerful, Intelligent Document Automation Layer for Box

Ephesoft Transact adds a layer of document intelligence to Box through its patented data analytics and machine learning technology. Documents that flow through Transact are automatically classified and data is extracted and routed to Box. Ephesoft supports the following document sources:

### Web-Based Scanning

Through its HTML 5 web browser scanning interface, users can use any TWAIN scanner to add documents.

### Hot Folders

Network folders now become an automated pathway to Box.

### Email

Email attachments and contents can be automatically processed.

### Mobile

Ephesoft's mobile application, SnapDoc, can feed the document capture workflow and Box.

### CMIS

Our Content Management connector allows you to migrate files from your legacy content system to Box.

### Web Upload

Upload documents through the Ephesoft web interface directly into the capture workflow.

### API/Custom

Ephesoft's open architecture allows you to interface with APIs to create custom document ingestion methods.

*Increase efficiency and reduce errors through automated classification and data extraction*

## The Power is in the Platform

Ephesoft Transact is the only true web-based and cloud adaptive capture technology on the market. Along with our web-based application interface, you have full access to a broad range of RESTful web service APIs that provide granular, micro-service capabilities. Need to OCR a document? Extract specific data? Classify on the fly? Our architecture provides developers with a full host of advanced document-based capture services.

## Seamless Integration with Box

At the completion of any capture workflow, documents and metadata can be exported to Box. The export plugin allows metadata mapping, control of the description, folder and filename. The integration into Box provides total control over your documents as well as the ability to scale to any use or department.
